In this paper, design methodology of 280nm CMOS switch is presented. Design optimization of RF CMOS switch is presented which is deciding proper selection of CMOS transistor parameters and switch size as per external circuit parameters. The CMOS switch of a 5-transistor stack with $W/L=1200\mu\text{m}/280\text{nm}$ provides insertion loss 14dB.

For the CMOS-based PA design, along with optimizing P out and PAE, it will be necessary to consider the voltage swing across the devices ' worst-case high V batt battery-voltage conditions for reliability reasons. The voltage swings that were achieved in the CMOS design are barely acceptable; additional steps should be taken to mitigate that voltage swing by clamping or regulating the control voltage.
