In addition, increased evidence has established a role for the intestinal microbiota in the development of colorectal cancer. Indeed, changes in the intestinal microbiota composition in colorectal cancer patients compared to control subjects have been reported. Several bacterial species have been shown to exhibit the pro-inflammatory and pro-carcinogenic properties, which could consequently have an impact on colorectal carcinogenesis.

## Read Online Intestinal Inflammation And Colorectal Cancer Falk Symposium

Individuals with IBD have a considerably increased risk for colorectal cancer (CRC) than the general population [122, 123], depending on the site of inflammation and the length of time with associated colitis. Chronic inflammatory responses can create a tumor-supporting microenvironment through activated immune cells that secrete multiple mediators, which may influence neoplastic development, invasion, metastasis, and angiogenesis.

Reducing Intestinal Inflammation and Colitis-Associated Cancer

Colorectal cancer (CRC) is a heterogeneous disease, including at least three major forms: hereditary, sporadic and colitis-associated CRC. A large body of evidence indicates that genetic mutations, epigenetic changes, chronic inflammation, diet and lifestyle are the risk factors for CRC.
