Service Oriented Architecture ( SOA) is

an architectural approach in which

application components makes use of a

collection of services available in a

network, which communicates with each

other. In service oriented architecture,

services communicate with each other,

either to pass the data or to coordinating

an activity.

~~What Is SOA? Service Oriented~~

~~Architecture [2020] Explained~~

Service-oriented architecture (SOA) is a

style of software design where services are

provided to the other components by application components, through a communication protocol over a network.

A SOA service is a discrete unit of functionality that can be accessed remotely and acted upon and updated independently, such as retrieving a credit card statement online.

~~Service-oriented architecture—Wikipedia~~

SOA, or service-oriented architecture, defines a way to make software components reusable via service interfaces. These interfaces utilize common communication standards in such a way that they can be rapidly incorporated into new applications without having to perform deep integration each time.

In SOA, a service is a self-contained unit of software designed to complete a specific task. Service-oriented architecture allows various services to communicate using a loose coupling system to either pass data or coordinate an activity. Loose coupling refers to a client of a service remaining independent of the service it requires. In addition, the client -- which can also be a service -- can communicate with other services, even when they are not related.

## ~~What is SOA? Understanding Service-Oriented Architecture~~

Service-Oriented Architecture (SOA) is an architectural style that supports service-orientation. Service-orientation is a way of thinking in terms of services and service-based development and the outcomes of services.

Service-Oriented Architecture (SOA) is an architectural approach in which applications make use of services available in the network. In this architecture, services are provided to form applications, through a communication call over the internet. SOA allows users to combine a large number of facilities from existing services to form applications.

Service-Oriented Architecture □ SOA  
Features and Benefits SOA starts with a simple idea □ the concept of service. This makes it possible to introduce other ideas, such as service bus, service composition, and service virtualization, each of which can be applied to the architecture of an enterprise to deliver benefits.

## ~~Service-Oriented Architecture □ SOA Features and Benefits~~

Defining SOA SOA (Service Oriented Architecture) is built on computer engineering approaches that offer an architectural advancement towards enterprise system. It describes a standard method for requesting services from distributed components and after that the results or outcome is managed.

Service-oriented architecture, or SOA, is all about creating an IT architecture centered around the services your organization provides. More clearly, SOA is an approach that helps delineate which features will be used to create an application geared toward services that need to communicate via messages.
