The trust crisis in healthcare. I know, trust can be an overused word, but there is no denying the importance it has both in our personal relationships and in our commerce. I can think of nothing more sacred than the trust we place in those who provide physical and mental services to us when we become injured, sick or frail.

The U.S. healthcare system exists in a trust crisis. Without trust, the United States Healthcare system is doomed to mediocrity.

Although healthcare is the most personal of interactions, the U.S. healthcare system is grounded in a business model based on a win-lose paradigm. Unfortunately, recent events both in society at large and within the healthcare industry have created negative trust resets(TM) that has only magnified the problem. Healthcare is unique in that it personally impacts every individual in the United States; whether being employed in the industry, an influencer such as media or government or a utilizer of healthcare services. If we are to address the challenges of access, cost and quality of healthcare we have to do more than alter payment and organizational models. We have to address the elephant in the room; trust. It will require a conscious behavior change by each stakeholder to improve trust across the system.

Over the last decade it has become popular to characterise relationships between individuals and institutions as suffering from a lack of trust, or indeed, as being in the midst of a 'trust crisis'. While loss of trust has become a common media by-line, relatively little attention has been devoted to exploring why trust has become so important for public and private organisations; what is actually understood by the term 'trust'; and whether it is an

appropriate mechanism for analysing and discussing complex institutional relationships. -- This project draws on the extensive literatures on trust, as well as institutional and organisational decision-making, to understand the factors shaping the contemporary salience of trust for the pharmaceutical industry. This sector is frequently portrayed as suffering from critically low levels of trust, particularly in terms of its public profile. Through semi structured in-depth interviews with respondents from industry and a number of its stakeholders -- particularly healthcare professionals, regulators and patient representatives - this project seeks to: outline what trust means to industry and healthcare actors; assess its rhetorical and substantive functions; explore the role trust plays in conferring legitimacy on institutional actors; evaluate its function as a quasi regulatory tool and as a driver of institutional cohesion and renewal; and understand how it functions as pretext for various economic stratagems. -- A number of key findings emerge from this research in relation to trust, the pharmaceutical industry and institutions more generally. Whilst those findings conform with previous depictions of trust as complex, multifaceted and emergent, however, they also suggest some novel interpretations.

approximately 15 million health workers - a fifth of the workforce needed to keep healthcare systems going. Global healthcare leader and award-winning author, Dr Mark Britnell, uses his unique insights from advising governments, executives, and clinicians in more than 70 countries, to present solutions to this impending crisis. *Human: Solving the Global Workforce Crisis in Healthcare*, calls for a reframing of the global debate about health and national wealth, and invites us to deal with this problem in new and adaptive ways that drive economic and human prosperity. Harnessing technology, it asks us to reimagine new models of care and levels of workforce agility. Drawing on experiences ranging from the world's most advanced hospitals to revolutionary new approaches in India and Africa, Dr Mark Britnell makes it clear what works - and what does not. Short and concise, this book gives a truly global perspective on the fundamental workforce issues facing health systems today.

Calming fears, alleviating suffering, enhancing and saving lives -- this is what motivates doctors virtually every single day. When the structure and culture in which physicians work are well aligned, being a doctor is a most rewarding job. But something has gone wrong in the physician world, and it is urgent that we fix it. Fundamental flaws in the US health care system make it more

difficult and less rewarding than ever to be a doctor. The convergence of a complex amalgam of forces prevents primary care and specialty physicians from doing what they most want to do: Put their patients first at every step in the care process every time. Barriers include regulation, bureaucracy, the liability burden, reduced reimbursements, and much more. Physicians must accept the responsibility for guiding our nation toward a better health care delivery system, but the pathway forward -- amidst jarring changes in our health care system -- is not always clear. In *The Doctor Crisis*, Dr. Jack Cochran, executive director of The Permanente Federation, and author Charles Kenney show how we can improve health care on a grassroots level, regardless of political policy disputes, by improving conditions for physicians and asking them to take on broader accountability; by calling on physicians to be effective leaders as well as excellent clinicians. The authors clarify the necessary steps required to enable physicians to focus on patient care and offer concrete ideas for establishing systems that place patients' needs above all else. Cochran and Kenney make a compelling case that fixing the doctor crisis is a prerequisite to achieving access to quality and affordable health care throughout the United States.

The influenza pandemic caused by the 2009 H1N1 virus underscores the immediate and critical need to prepare for a public health emergency in which thousands, tens of thousands, or even hundreds of thousands of people suddenly seek and require medical care in communities across the United States. Guidance for Establishing Crisis Standards of Care for Use in Disaster Situations draws from a broad spectrum of expertise—including state and local public health, emergency medicine and response, primary care, nursing, palliative care, ethics, the law, behavioral health, and risk communication—to offer guidance toward establishing standards of care that should apply to disaster situations, both naturally occurring and man-made, under conditions in which resources are scarce. This book explores two case studies that illustrate the application of the guidance and principles laid out in the report. One scenario focuses on a gradual-onset pandemic flu. The other scenario focuses on an earthquake and the particular issues that would arise during a no-notice event. Outlining current concepts and offering guidance, this book will prove an asset to state and local public health officials, health care facilities, and professionals in the development of systematic and comprehensive policies and protocols for standards of care in disasters when resources are scarce. In addition, the extensive operations section of the book

provides guidance to clinicians, health care institutions, and state and local public health officials for how crisis standards of care should be implemented in a disaster situation.
