The uniformization theorem for surfaces states that the upper half-plane is the universal covering space of surfaces with constant negative Gaussian curvature. The closed upper half-plane is the union of the upper half-plane and the real axis. It is the closure of the upper half-plane. Affine geometry

Bernt Spiegel's book, "The Upper Half of the Motorcycle on the Unity of Rider and Machine," is in its ninth printing and finally translated into English. A German behavioral psychologist, Spiegel uncovers new insights and gives unique perspectives that challenge the reader to think about riding from an intrinsic standpoint instead of a mechanical one."

The open unit disk, the plane, and the upper half-plane. The function \exp is an example of a real analytic and bijective function from the open unit disk to the plane; its inverse function is also analytic. Considered as a real 2-dimensional analytic manifold, the open unit disk is therefore isomorphic to the whole plane. In particular, the open unit disk is homeomorphic to the whole plane.

Bernt Spiegel's *The Upper Half of the Motorcycle* was a best-selling motorcycling book in its original German with multiple editions and printings to its credit. Now translated into English, its provocative message is available to a wider audience. Spiegel's metaphor considers the rider and the motorcycle as a single unit, the rider being the upper half. Taking a multidisciplinary approach, the author draws on anthropology, psychology, biology, physics, and other disciplines to analyze the theory and function of the man-machine unit. Motorcycle riding is seen as a junction where people have created machines for personal transport and then become so adept at using them that the machine becomes like an extension of the rider themselves. The ultimate goal for riders is the integration of the man-machine interface and subsequent skill development to the point of virtuosity. Spiegel considers the various aspects of motorcycle riding that must be understood, practiced, and mastered before virtuosity can be attained. Many anecdotes, supplementary material, and in-depth treatment of specialized topics is contained in sidebars and footnotes. Numerous diagrams and photographs illustrate the book's principles allowing the reader to consider and develop their riding skill set.

In this work, the author defines the Γ equivariant form of Berezin quantization, where Γ is a discrete lattice in $\mathrm{PSL}(2, \mathbb{R})$. The Γ equivariant form of the quantization corresponds to a deformation of the space \mathbb{H}^2

\mathbb{H}/Γ (\mathbb{H} being the upper halfplane). The von Neumann algebras in the deformation (obtained via the Gelfand-Naimark-Segal construction from the trace) are type II_1 factors. When Γ is $PSL(2, \mathbb{Z})$, these factors correspond (in the setting considered by K. Dykema and independently by the author, based on the random matrix model of D. Voiculescu) to free group von Neumann algebras with a 'fractional number of generators'. The number of generators turns out to be a function of Planck's deformation constant. The Connes cyclic 2 -cohomology associated with the deformation is analyzed and turns out to be (by using an automorphic forms construction) the coboundary of an (unbounded) cycle.
